

User Instruction

Congratulation !

You now own the most advanced humidification system for cigars. To enjoy the service of CigarSpa 2.0. please observe the following points :

First start

Unpack CigarSpa 2.0

You will see this display :

Press the blue button once (there is only one button !)
(there are already batteries installed (4 x AA , good for 3-4 years !)

Now you will see this display :

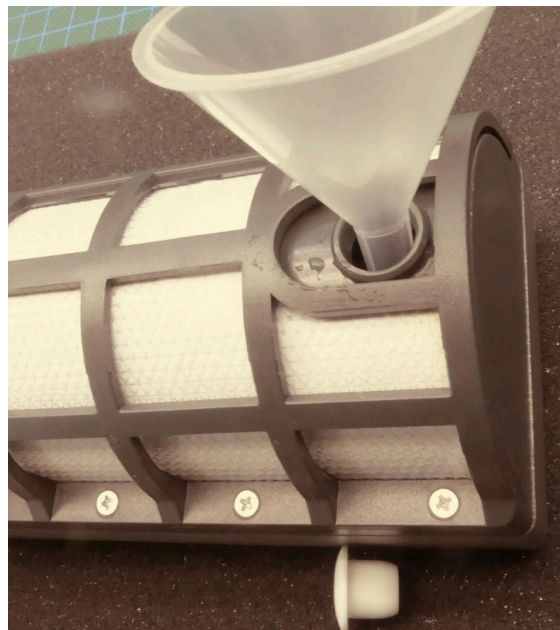

The display will stay alight for 12 seconds – after that it turns black again (to save battery power) To see the readings again – press the blue button once !

To be able to create humidity we need water – to be very precise

“ FRESH DISTILLED WATER ”

Only fresh distilled water (it is good enough from the supermarket – important thing is – FRESH – means : less than 1 year old !! (old distilled water can also create some slime)

Please use the provided funnel – fill up to the top.
If you spill some water – no problem (unless it affects the electronic board !) – just take a tissue paper and touch it off.
See photo how to use the funnel

DO NOT RUB with a cloth or similar. You will damage the membrane !

CigarSpa 2.0 will now start it's job – to create humidification, control it to the level you want.

We have programmed CigarSpa 2.0. to show in stand by a black display – this saves battery power !

Stand by

When you want see what is going on with your cigars – just press the blue button !

What is going on ?

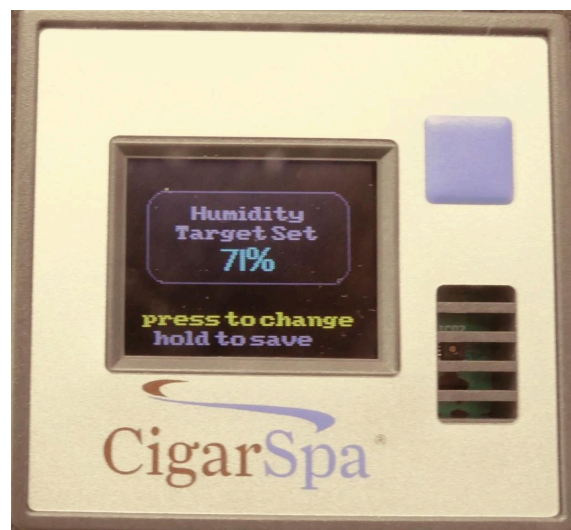

The level of humidification we have set to 71% (many of you like the cigar at that level of humidification)

BUT

If you finally want to change (drier or more humid ?) you can do it.

Between 55 % and 75% you can choose.

Press and hold the blue button for 2 seconds – you will see this display

When you press the blue button – it will change in steps of 1 % , up to 75 % and then from 55 % upwards.

As soon as you see the level in the display you want to select , you stop. After a few seconds the display will show you this (we have selected in this case 68 %)

Now CigarSpa 2.0. will bring the humidity level very slowly to the level you have selected .

The evaporation unit (the white material at the top of CigarSpa 2.0.) will work slowly (because cigars hate quick changes in humidity !!)

Once the figure in the display lower left HUMIDITY (actual humidity %) has reached the TARGET figure (TARGET set at 71 % - also HUMIDITY shows 71%) the air inside your humidor has reached the level you want.

BUT

How about your cigars ???

The humidity in the air is one thing – but the humidity inside the cigars is THE thing ! The MOST important thing !

How to do it ?

We measure every 30 minutes the air inside the humidor – and compare it with the previous readings.

Once the reading is steady – does not move ! – for 3 days =

We can conclude that everything in the humidor (wood – cigars – air) are at the TARGET level !

Means (in this case) all figures show 71 ! (apart from the temperature reading - lower right !)

From now on every cigar put into the humidor will be humidified to the TARGET level !

ENJOY YOUR CIGARS !

There will be a moment when the water has been used up.
In this moment you will see – after pressing the blue button ! –
the display like this

Please refill (with fresh distilled water only !) the tank.
Please use the funnel provided to fill up – should some water
spill over – please use soft paper to tab it off.
DO NOT RUB the membrane!
See photo from the first filling !

After filling ...

Press the blue button – you still see the "WATER LOW " sign
Press once more the blue button – now you see this

The same happens when the batteries will be too low to operate the unit.

You will see this

Please replace the batteries (ordinary 4 x AA) by opening the battery compartment (at the bottom of the unit, one cross screw)

Once you have done it – the unit goes back to normal operation. For another 3 – 4 years !

PLEASE

Operate CigarSpa 2.0. always in a position where the battery compartment is at the bottom.

If some dirt is at the membrane – take a soft brush to remove it.

If any question ...
